NEW PATIENT ORTHOPEDIC EVALUATION

Provider: Rowan K. Adebayo, MD Referring: Miriam A. Castellanos, MD

CHIEF COMPLAINT: Neck pain with left arm tingling; low back pain. Motor vehicle collision 02/11/2026.

HISTORY OF PRESENT ILLNESS: Mr. Okafor is a 44-year-old right-hand-dominant male who was the restrained driver of a stopped vehicle struck from behind on 02/11/2026. Evaluated in the emergency department the same day; CT cervical spine and lumbar radiographs negative for fracture. He describes constant posterior neck pain, 6/10, with intermittent paresthesias radiating to the left thumb and index finger, aggravated by cervical extension and prolonged computer work. Low back pain is 3–4/10, axial,

without radiation. He denies bowel or bladder symptoms. He has been taking ibuprofen and cyclobenzaprine with partial relief. He has not returned to full duty.

PRIOR HISTORY: He reports an episode of low back pain in fall 2023 after lifting at work, treated with six chiropractic visits with complete resolution. He denies any prior neck pain, prior neck injury, or prior arm symptoms. Records reviewed: ED note 02/11/2026, PCP note 02/16/2026.

PHYSICAL EXAMINATION: Well-developed male in no acute distress. Cervical spine: paraspinal tenderness C5–C7, no step-off. Range of motion: flexion 40, extension 20 (painful), rotation 45 bilaterally. Spurling's maneuver reproduces left arm paresthesias. Upper extremities: strength 5/5 in deltoid, biceps,

triceps, wrist extensors, grip; subjectively decreased light touch left C6 distribution; reflexes biceps 2+/2+, triceps 2+/2+, brachioradialis 1+ left / 2+ right. Lumbar spine: paraspinal tenderness, flexion to 60 degrees, straight-leg raise negative bilaterally, lower extremity strength and sensation intact.

03/03/2026: mild L4–L5 bulge, no nerve compromise.

EXAM: Unchanged from 02/24/2026; Spurling's positive left; strength 5/5; left brachioradialis reflex 1+.

ASSESSMENT

ORTHOPEDIC FOLLOW-UP — SURGICAL DISCUSSION

Provider: Rowan K. Adebayo, MD

INTERVAL HISTORY: Observation admission 04/28–04/30/2026 for intractable radicular pain after lifting at home; now back to 4/10 neck pain with intermittent left C6 paresthesias. First ESI 04/21/2026 gave partial relief; second ESI planned. Physical therapy ongoing, visit 16 of planned 30; cervical mobility improved.

EXAM: Spurling's positive left; strength 5/5; left brachioradialis reflex 1+; sensation decreased left C6.

ASSESSMENT: Left C5–C6 disc protrusion with C6 radiculopathy, post-traumatic (MVC 02/11/2026), incompletely responsive to conservative care at 14 weeks.

PLAN: Proceed with second cervical ESI as planned by pain management. If radicular symptoms persist beyond 3 months after the second injection, recommend anterior cervical discectomy and fusion C5–C6; risks, benefits, and alternatives discussed in detail today. Continue PT. Work restrictions continue: no lifting over 20 lb, no overhead work.

ORTHOPEDIC FOLLOW-UP

Provider: Rowan K. Adebayo, MD

INTERVAL HISTORY: Completed 30 visits of physical therapy (discharged 06/26/2026). Second ESI 06/09/2026 with approximately 70% sustained improvement in arm symptoms. Neck pain 3/10; paresthesias only with sustained extension. Returned to modified duty.

EXAM: Cervical ROM near full; Spurling's negative; strength 5/5; sensation intact to light touch; reflexes symmetric.

ASSESSMENT: Left C5–C6 disc protrusion with C6 radiculopathy, post-traumatic, improving with conservative care. Surgery deferred.

PLAN: Home exercise program. Gabapentin taper. Work: lifting limit 30 lb, may perform overhead work in 15-minute intervals. Maximum medical improvement not yet reached; re-evaluate in 6–8 weeks.

ORTHOPEDIC FOLLOW-UP — RE-EVALUATION

Provider: Rowan K. Adebayo, MD

INTERVAL HISTORY: No treatment since last visit 07/07/2026; patient reports he was traveling for work and could not schedule sooner. Neck pain 2–3/10, occasional left thumb tingling after long drives. Off gabapentin. Working full duty with self-imposed lifting caution.

EXAM: Cervical ROM full; Spurling's negative; strength 5/5; sensation intact; reflexes symmetric.

ASSESSMENT: Left C5–C6 disc protrusion with C6 radiculopathy, post-traumatic (MVC 02/11/2026), status-post two cervical ESIs and 30 visits of physical therapy. Residual intermittent paresthesias.

PLAN: Maximum medical improvement reached as of today. Permanent restrictions: none. Future care: the patient remains at risk of recurrent radicular symptoms at C5–C6; if recurrence, options include repeat ESI or ACDF. Release from active care; return as needed.

MRI CERVICAL SPINE WITHOUT CONTRAST

Exam date: 03/03/2026 Ordering: Rowan K. Adebayo, MD Radiologist: Ingrid S. Halvorsen, MD

INDICATION: Left C6 radiculopathy after motor vehicle collision 02/11/2026.

TECHNIQUE: Sagittal T1, T2, STIR; axial T2 and gradient echo through C2–T1.

FINDINGS: Straightening of cervical lordosis. Vertebral bodies normal in height and signal; no marrow edema. C2–C3 through C4–C5: normal. C5–C6: left paracentral disc protrusion measuring approximately 4 mm with mild associated annular fissure, effacing the ventral thecal sac and contacting the exiting left C6 nerve root within the left neural foramen; moderate left foraminal narrowing. Mild endplate spurring. C6–C7: minimal disc bulge without stenosis. C7–T1: normal. Cord signal normal.

IMPRESSION: 1. Left paracentral C5–C6 disc protrusion with annular fissure, contacting the left C6 nerve root and producing moderate left foraminal stenosis; correlates with the patient's left C6 radicular symptoms. Annular fissure and STIR signal favor a recent injury superimposed on mild degenerative change. 2. Minimal C6–C7 bulge.

PAIN MANAGEMENT CONSULTATION

Provider: Selin O. Demirci, MD Referring: Rowan K. Adebayo, MD

REASON FOR CONSULTATION: Left C6 radiculopathy secondary to C5–C6 disc protrusion, post-MVC 02/11/2026; consideration of cervical epidural steroid injection.

HISTORY: 44-year-old male, restrained driver rear-ended 02/11/2026. Neck pain 6/10 with left thumb/index paresthesias. Three weeks of physical therapy with modest improvement in mobility but persistent radicular symptoms. Medications: ibuprofen 600 mg PRN, gabapentin 300 mg BID, cyclobenzaprine HS PRN. No anticoagulants. No prior spinal injections.

EXAM: Cervical paraspinal tenderness; Spurling's positive left; strength 5/5; sensation decreased left C6; reflexes as documented by orthopedics.

IMAGING: MRI cervical spine 03/03/2026 — left paracentral C5–C6 protrusion with annular fissure, moderate left foraminal stenosis.

ASSESSMENT: Left C6 radiculopathy secondary to post-traumatic C5–C6 disc protrusion.

PLAN: Cervical interlaminar epidural steroid injection at C6–C7 (approach to C5–C6 target), fluoroscopically guided, with sedation. Risks/benefits/alternatives discussed; consent obtained. Continue PT. Follow up 3 weeks after injection.

PROCEDURE NOTE — CERVICAL INTERLAMINAR EPIDURAL STEROID INJECTION

Provider: Selin O. Demirci, MD Anesthesia: moderate sedation (midazolam 2 mg IV) Location: Summit Pain & Spine procedure suite

PREOPERATIVE DIAGNOSIS: Left C6 radiculopathy, C5–C6 disc protrusion (post-MVC 02/11/2026).

POSTOPERATIVE DIAGNOSIS: Same.

PROCEDURE: Fluoroscopically guided cervical interlaminar epidural steroid injection, C6–C7 interspace (62321).

DESCRIPTION: Patient positioned prone. Skin prepped and draped in sterile fashion. Under fluoroscopic guidance, the C6–C7 interlaminar space was identified. Following local anesthesia, an 18-gauge Tuohy needle was advanced using loss-of-resistance technique. Contrast (1 mL Omnipaque 240) confirmed epidural spread without vascular or intrathecal uptake, with cephalad flow to the C5–C6 level.

Dexamethasone 10 mg in 2 mL preservative-free saline was injected. Needle removed. No complications.

ESTIMATED BLOOD LOSS: Minimal.

DISPOSITION: Recovered in the post-procedure area; vital signs stable; discharged ambulatory with driver. Post-procedure instructions given.
